

During this assignment, I had to design and implement code that would be preferred by a software tester over any other software design. Thinking about my code from this perspective made me think about what a tester would be looking for from both a code and a requirements standpoint.

I made sure my code was separated into functions that were

- a. Independent from one another
- b. Where named clear function names
- c. Included clearly named variable names

All of these things together made me feel that if a tester were to review my code, they would have no problem understanding the concise code I wrote and what each function as well as what my script overall should be doing.
